

Pipe Back Relief Valve

These Piped Back Relief Valves (PBRV) offer a safer and more efficient way to deal with the boil off from the liquid in the line, Instead of just releasing the gas into the atmosphere like an ordinary Pressure relief valve this solution pipes it back into the line before the the valve where a lot of the warming of the liquid will occur, in many cases this will then cool again and can be re used. This has the added benefit of not releasing the gas into the atmosphere so low oxygen and cold burns will not be a concern.

Key Features

-  Safe and efficient way of dealing with boil off from excess liquid.
-  Easy to replace pressure relief valves
-  High quality stainless steel construction
-  Available at most common liquid nitrogen pressures.
